### **AutoCAD Crack + Product Key Full For Windows [March-2022]**

All AutoCAD software runs on Microsoft Windows. There is also a mobile app for Android devices, iOS, Linux, macOS, and the web apps are available for Microsoft Edge and Chrome. The AutoCAD file format (or drawing format) is proprietary. AutoCAD files are made up of objects, such as lines, arcs, circles, polygons, and text, and relationships between those objects, such as when an arc connects to a line or a circle to a point. When an object is moved or resized, AutoCAD reevaluates and updates the drawing file with the results. A drawing file can also be saved as a grayscale raster image (.png). The key tool for drawing, editing, and designing in AutoCAD is the DRAWSHEET. An important AutoCAD feature is the ability to align (shift) objects to a common point, which automatically determines and records the X,Y position of that point. This feature is known as "alignment" and the common point is known as an "alignment point." Another key AutoCAD feature is the ability to work in 2D and 3D space. This means that you can draw objects in the 2D space (on the X,Y plane), then create a 3D model of those objects, and finally produce a 2D drawing (a drawing with 2D text and lines) of that 3D model. There are three basic types of objects: lines, arcs, and polygons (polygons can be either 2D or 3D). You can use either one or more lines, arcs, or polygons to draw shapes. You can add objects, such as lines, arcs, circles, polygons, etc. to a drawing. Lines, arcs, circles, and polygons can be connected by inserting an "end" to another object and by using the "join" command. Lines can also be terminated with a small square, and polygons can be closed with a "close" command. You can copy objects by using the "copy" command. You can merge objects by using the "merge" command. You can undo an object's last action using the "undo" command. You can draw additional copies of objects using the "duplicate" command. You can delete objects by using the "delete" command. You can reposition objects by using the "move" command. You can add

I have some qtable view in my application, and I need to scroll the qtable view to top, when data has been added to it. I can't use the scrollToTop() function in my application, because the table is not part of my QMainWindow, I use this code: view = self.ui.tableView view.scrollToTop() When the data is inserted to the table, the table has moved down, but the scrollbar is not moved, it's stuck at its position. What can I do to scroll the tableView to top? A: If you're inside the main window, scrollToTop() should work. If you're outside of the main window, get the parent window and call scrollToTop() on it: widget = self.ui.tableView.parent() widget.scrollToTop() A: The point is that QMainWindow is "horizontal" (contains many QWidget), QTableView is "vertical" (contains only one QWidget). A parent is just a QWidget, for example the parent of QTableView is QMainWindow. That's why a simple method view.scrollToTop() is not working for you. You should use the whole widget, parent of QTableView: widget = self.ui.tableView.parent() widget.scrollToTop() It will work for both QWidget and QMainWindow.
